(54) Abstract Title
Sealing strip for a vehicle having first and second covering layers

(57) A strip (22) of flexible thermoplastic elastomer (TPE) material has a first protective closed-cell covering (24) and a second covering (26) on the outside of the first covering, the second covering having a lower coefficient of friction than the first covering and preferably being formed of hard rubber. Preferably the strip (22) is of hollow tubular form (8) and is attached to a mounting part which may be a conventional channel-shaped gripping part (12), the combination taking the form of a sealing strip (6) suitable for a vehicle door frame. The mounting part may also be of thermoplastic material and the first and second coverings preferably extend over the mounting part. The thermoplastic strip and coverings are preferably produced by extrusion and parts of the same material may be co-extruded.

SEALING STRIPS

The invention relates to sealing strips. Sealing strips embodying the invention, and to be described in more detail below by way of example only, are for use in carrying out sealing functions in motor vehicle body construction.

According to the invention, there is provided a strip of flexible thermoplastic elastomer material having a first, thin closed-cell covering thereover, and a second thin covering on the outside of the first covering, the second covering presenting an outwardly facing surface having a lower coefficient of friction than the first covering.

According to the invention, there is also provided a method of making a sealing strip, comprising the steps of extruding and foaming thermoplastic elastomer material, extruding a first thin covering of closed-cell material onto at least part of the outer surface of the thermoplastic elastomer material, and extruding a second, thin covering onto at least part of the outside of the first covering, the second covering presenting an outwardly facing surface having a lower coefficient of friction than the first covering.

Sealing strips embodying the invention, for use in carrying out sealing functions in motor vehicle bodies, will now be described, by way of example only, with reference to the accompanying diagrammatic drawings in which:

Figure 1 is a perspective view of a motor vehicle to which the sealing strips may be fitted; and

Figure 2 is a perspective view of one of the sealing strips in cross-section.

Figure 1 shows a motor vehicle body 5 with one of its doors removed to show a sealing strip 6 mounted around the periphery of the door opening. In use, the closing door closes onto the sealing strip 6 to provide a weather-tight seal.

One form of the sealing strip 6 is shown in Figure 2. It comprises a sealing portion 8 and a gripping or mounting portion 10. The gripping portion 10 is in the form of a longitudinal channel 12. In use, this is embracingly clamped to the surround of the door opening. More specifically, the surround of the door opening is normally defined by a flange where the inner and outer body panels are welded together.

As shown in Figure 2, the gripping portion 10 comprises a reinforcing core or carrier 14 such as made of resilient metal or other material, which is embedded in flexible material 16 such as rubber or plastics material. For example, the carrier 14 may be made of metal and in the form of (inverted) U-shaped elements arranged side-by-side to define the channel 12 and connected together by integral short connecting links or disconnected from each other. Other forms of carrier are, of course, possible. The carrier may be made of wire looped to and fro. The carrier 14 may be incorporated in the material 16 using a

cross-head extruder. The carrier need not be made of metal. A flexible but substantially non-extensible tape may be incorporated into the material 16.

The material 16 is formed to define integral gripping lips 18 positioned on the opposite inside facing walls of the channel 12. These make contact with the opposite faces of the flange and increase the frictional gripping of the gripping portion 10. Advantageously, the material of the lips 18 is arranged to be softer than the remainder of the extruded material 16 to increase the frictional grip of the lips against the flange.

As shown in Figure 2, the material 16 is formed to define a so-called "cosmetic lip" 20. This is used to cover over, and to help to secure, the edge of a trim panel or the like inside the vehicle body.

The gripping portion 10 may be provided with a fabric covering 21.

The sealing portion 8 is of generally hollow tubular form. It comprises soft cellular material 22 forming a relatively thick tubular wall. Advantageously, the material 22 is extruded thermoplastic elastomer (TPE) material which is foamed by a suitable method such as with the use of water or by means of a chemical foaming agent. The wall 22 is thus very soft and also very light in weight. In order to provide a protective covering over the hollow cells of the material 22 which may be of open-cellular form, it is covered by a thin extruded covering layer or skin 24 using a suitable known method to produce a thin

covering of closed-cellular form.

The sealing portion 8 is attached to the gripping portion 10 by any suitable method.

However, instead, the extruded material 16 of the gripping portion 10 may also be made of soft cellular extruded TPE material similar to the material 22, foamed in the same way, and co-extruded with the material 22. In such a case, the thin skin 24 would extend over the outside surface of the material 16 of the gripping portion 10.

In use, the gripping portion 10 mounts the sealing strip on the door surround, so that the sealing portion 8 extends around the door opening, on the outside of the vehicle body. The closing door thus partially compresses the sealing portion 10 which thereby provides a weather-tight seal. When mounted in this way, the mouth of the channel 12 will of course face away from the centre of the door opening.

Although the use of TPE material for the sealing portion 8 (and possibly also for the gripping portion 10) is found to be very advantageous, being in particular very light in weight, the skin 24, which is required in order to cover the cells of the material 22, is found to present a relatively high friction surface. This may be disadvantageous in certain circumstances. For example, the closing vehicle door will partially slide across the surface of the sealing portion 8, particularly adjacent the "A" pillar of the vehicle where it is hinged. High friction contact at this position can cause problems.

In accordance with a feature of the embodiment being described, therefore, the sealing portion 8 is provided with an additional, external, skin 26 which is extruded over the outside of the skin 24 and is arranged to provide a low friction external surface. The skin 26 may be extruded hard rubber or similar material.

In this way, the advantages of TPE material are preserved and the disadvantage of the relatively high friction surface of the skin 24 is overcome.

It will be appreciated that the sealing section 8, with the skins 24 and 26 thereon, can have any suitable shape. For example, it may be in the form of a lip instead of a tube. Instead of being used as a door seal, it may be used, for example, as a waist seal for the window opening of a vehicle door. In such a case, the low friction surface of the skin 26 is particularly advantageous.

The skin 26 can extend over the outside surface of the gripping section 10. However, the sealing section 8 need not be attached to a gripping section.

CLAIMS

1. A strip of flexible thermoplastic elastomer material having a first, thin closed-cell covering thereover, and a second thin covering on the outside of the first covering, the second covering presenting an outwardly facing surface having a lower coefficient of friction than the first covering.
2. A strip according to claim 1, in which the second covering is made of hard rubber.
3. A strip according to claim 1 or 2, of hollow tubular form.
4. A strip according to any preceding claim, attached to a longitudinally extending mounting part for mounting the strip adjacent a movable member to be compressed thereby to provide a sealing function.
5. A strip according to claim 4, in which the mounting part is also made of thermoplastic elastomer material and the first covering extends thereover.
6. A strip according to claim 5, in which the second covering extends over the first covering on the mounting part.
7. A strip according to any preceding claim, in which the thermoplastic elastomer

material and the two coverings are produced by extrusion.

8. A strip according to claim 5 or 6, in which the thermoplastic elastomer material of the strip and of the mounting part is co-extruded and in which at least the first covering on the strip and on the mounting part is co-extruded.
9. A strip according to any preceding claim, in which the thermoplastic elastomer material is of cellular or foamed form.
10. A method of making a sealing strip, comprising the steps of extruding and foaming thermoplastic elastomer material, extruding a first thin covering of closed-cell material onto at least part of the outer surface of the thermoplastic elastomer material, and extruding a second, thin covering onto at least part of the outside of the first covering, the second covering presenting an outwardly facing surface having a lower coefficient of friction than the first covering.
11. A strip, substantially as described with reference to the accompanying drawing.
12. A method of making a strip, substantially as described with reference to the accompanying drawings.
